Talaumidin promotes neurite outgrowth in NGF-differentiating PC12 cells

Talaumidin (**1**)
isolated from Brazilian plant
Aristolochia arcuata

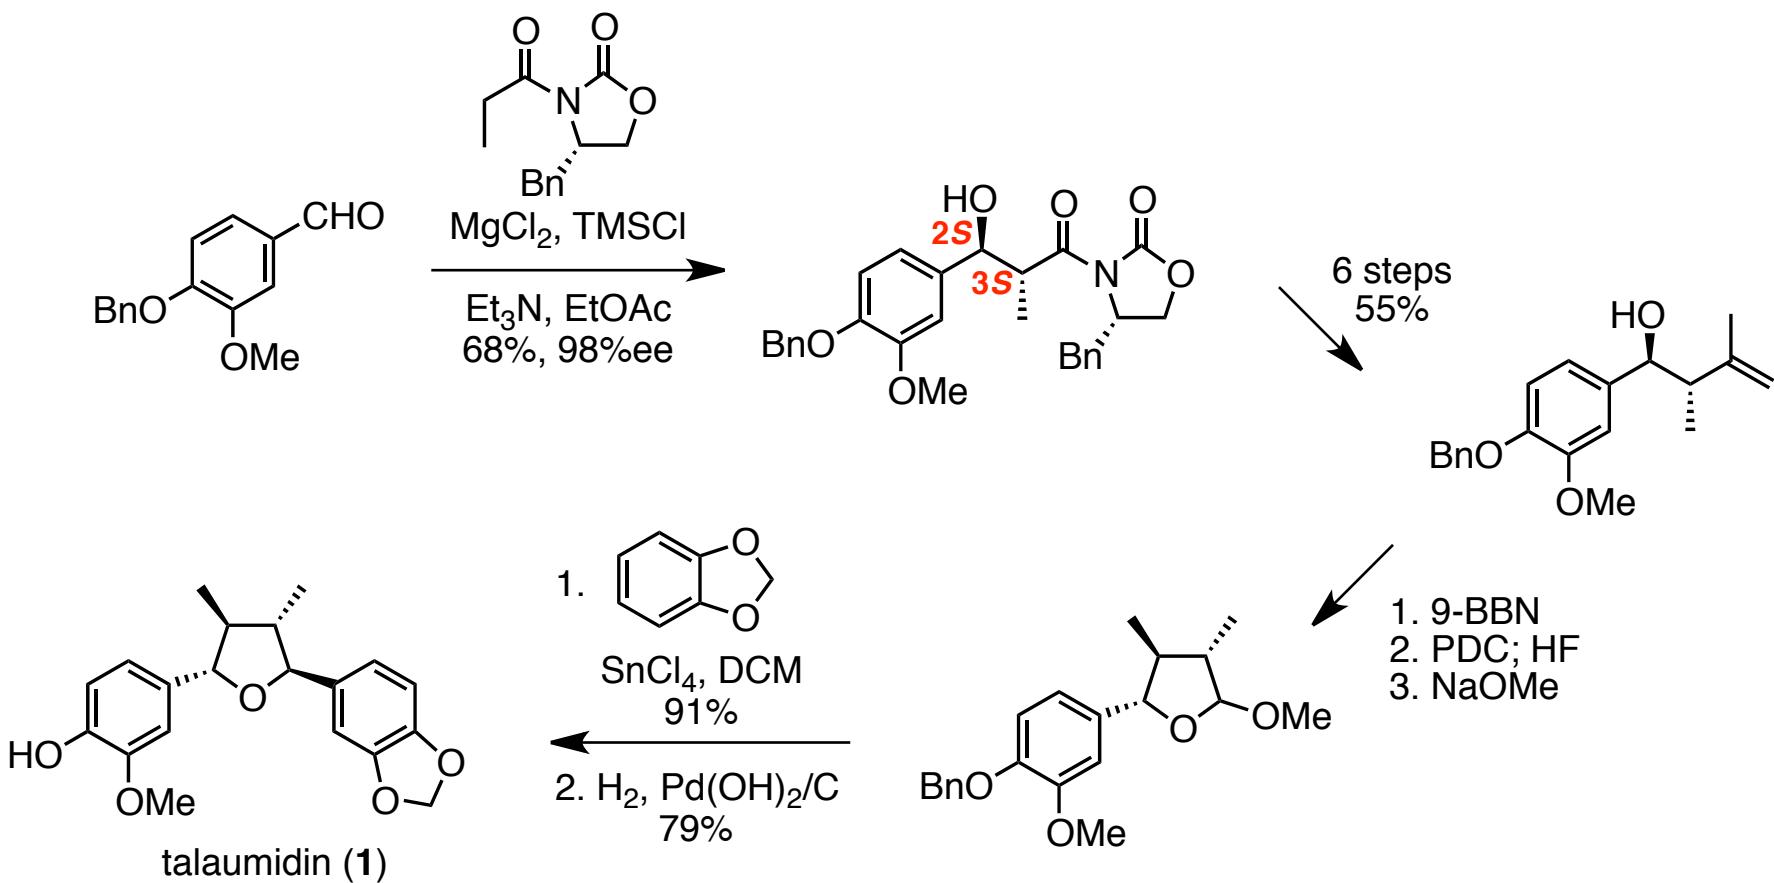

control (NGF 20 ng/mL)

1: 30 μM + NGF 20 ng/mL

Comparison of neurite length of NGF-differentiating PC12 cells promoted by talaumidin and its stereoisomers at 10 and 30 μ M

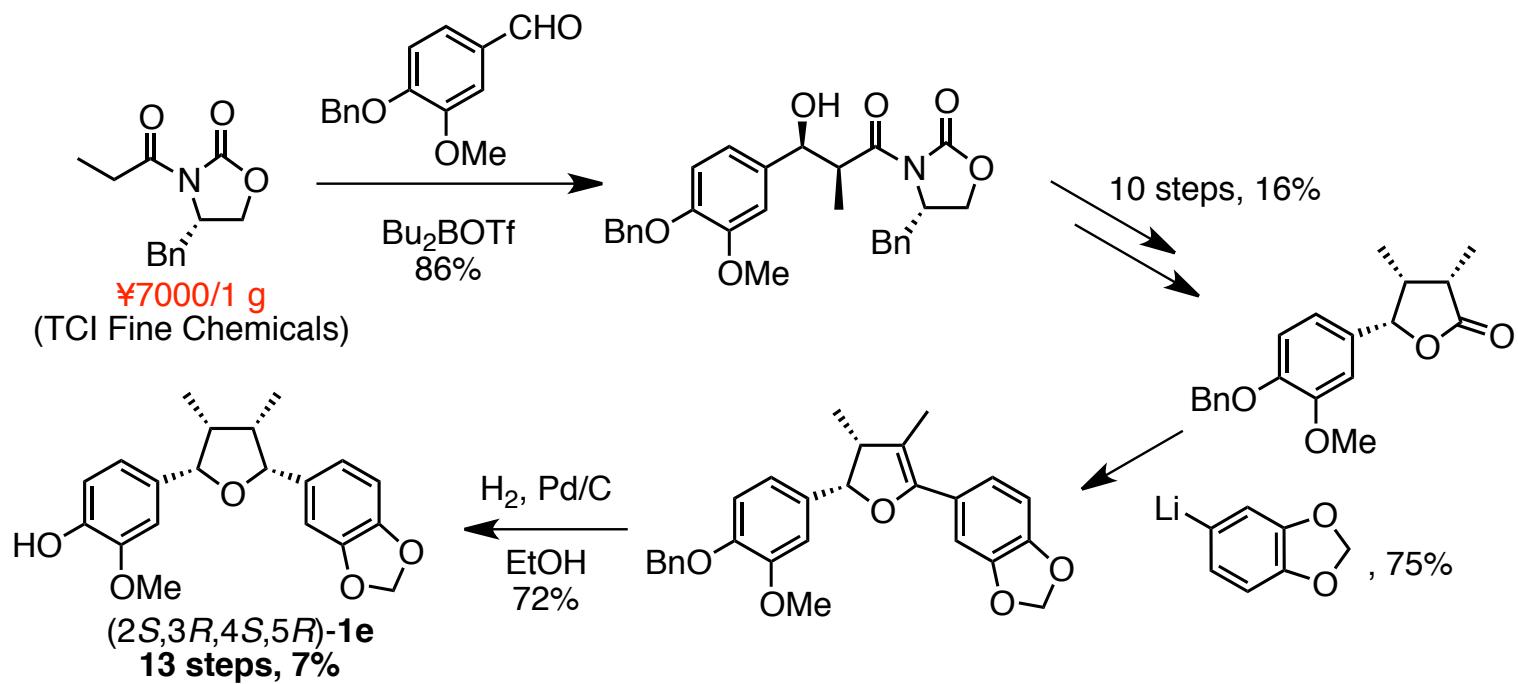

PC12 cells were cultured in 24-well plate in DMEM/10%HS+5%FBS for 1day at the density of 2000 cells/ cm^2 then medium change to DMEM/2%HS+ 1%FBS with control (0.5% EtOH), NGF 2 ng/mL, NGF 2 ng/mL + samples 10mM and 30mM. after 96 hr, PC12 cells were fixed and stained with methylene blue, then were quantified for the neurite length. At least 100 cells were selected for calculating the neurite length. Data were expressed a mean as \pm SE. *, $P<0.05$; **, $P<0.01$ compared with NGF by Dunnett's t-test.

green: BrdU

Hippocampal neurogenesis in olfactory bulbectomized (OBX) mice

To determine the rate of hippocampal neurogenesis, 5-bromo-2-deoxyuridine (BrdU) (50 mg/kg) was administrated by i. p. once a day for 7 days for 22 to 28 days after OBX operation. On day 30, mice were sacrificed. The number of BrdU/NeuN double-positive cells in the dentate gyrus of hippocampus was counted.

Conclusion

Neurite outgrowth promoting activity in PC12 cells

rac-1e \approx ***(2S,3R,4S,5R)-1e*** > **talaumidin**
